Review: Mathematical Induction

Suppose that you want to prove that property P(n) is true for every natural number n.

Suppose that we can prove the following two facts:

Base case: P(1)

Inductive step: For any $k \ge 1$, $P(k) \Rightarrow P(k+1)$

The **Principle of Mathematical Induction** states that P(n) is true for every natural number n.

The assumption P(k) in the inductive step is usually referred to as the Induction Hypothesis.

Theorem 1 For any integer $n \geq 1$, $\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \dots + \frac{1}{n^2} < 2$.

Theorem 1

For any integer
$$n \ge 1$$
, $\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \dots + \frac{1}{n^2} < 2$.

Proof.

The statement P(n) that we want to prove is $\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \cdots + \frac{1}{n^2} < 2$ ".

Theorem 1

For any integer $n \ge 1$, $\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \dots + \frac{1}{n^2} < 2$.

Proof.

The statement P(n) that we want to prove is " $\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \cdots + \frac{1}{n^2} < 2$ ".

Case case: For n = 1, the statement is true because 1 < 2.

Theorem 1

For any integer $n \ge 1$, $\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \dots + \frac{1}{n^2} < 2$.

Proof.

The statement P(n) that we want to prove is " $\frac{1}{1^2}+\frac{1}{2^2}+\frac{1}{3^2}+\cdots+\frac{1}{n^2}<2$ ".

Case case: For n = 1, the statement is true because 1 < 2.

Inductive step: For $k \geq 1$, let's assume P(k) and we prove that P(k+1) is true.

Theorem 1

For any integer $n \ge 1$, $\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \dots + \frac{1}{n^2} < 2$.

Proof.

The statement P(n) that we want to prove is " $\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \cdots + \frac{1}{n^2} < 2$ ".

Case case: For n = 1, the statement is true because 1 < 2.

Inductive step: For $k \geq 1$, let's assume P(k) and we prove that P(k+1) is true.

The induction hypothesis is: $\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \cdots + \frac{1}{k^2} < 2$.

We want to show P(k+1), i.e.,

$$\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \dots + \frac{1}{k^2} + \frac{1}{(k+1)^2} < 2.$$

Then...

▶ Is the assumption

$$\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \dots + \frac{1}{k^2} < 2.$$

"strong" enough to prove

$$\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \dots + \frac{1}{k^2} + \frac{1}{(k+1)^2} < 2$$
?

Why?

▶ Is the assumption

$$\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \dots + \frac{1}{k^2} < 2.$$

"strong" enough to prove

$$\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \dots + \frac{1}{k^2} + \frac{1}{(k+1)^2} < 2$$
?

Why?

▶ To prove P(k+1), we need a "gap" between the LHS and 2, so that we can add 1/(k+1) without blowing up the RHS.

- Let's see a few values of the sum:
 - ▶ 1/1 = 1.

- Let's see a few values of the sum:
 - ▶ 1/1 = 1.
 - ▶ 1/1 + 1/4 = 1.25.

- Let's see a few values of the sum:
 - ▶ 1/1 = 1.
 - 1/1 + 1/4 = 1.25.
 - $1/1 + 1/4 + 1/9 \approx 1.361.$

- Let's see a few values of the sum:
 - ▶ 1/1 = 1.
 - 1/1 + 1/4 = 1.25.
 - $1/1 + 1/4 + 1/9 \approx 1.361.$
 - $1/1 + 1/4 + 1/9 + 1/16 \approx 1.4236.$

- Let's see a few values of the sum:
 - ▶ 1/1 = 1.
 - 1/1 + 1/4 = 1.25.
 - $1/1 + 1/4 + 1/9 \approx 1.361.$
 - $1/1 + 1/4 + 1/9 + 1/16 \approx 1.4236.$
 - ► $1/1 + 1/4 + 1/9 + 1/16 + 1/25 \approx 1.4636$.

Yes, there is a gap. But how large?

- Let's see a few values of the sum:
 - ▶ 1/1 = 1.
 - 1/1 + 1/4 = 1.25.
 - $1/1 + 1/4 + 1/9 \approx 1.361.$
 - $1/1 + 1/4 + 1/9 + 1/16 \approx 1.4236.$
 - ► $1/1 + 1/4 + 1/9 + 1/16 + 1/25 \approx 1.4636$.

Yes, there is a gap. But how large?

▶ We need the gap to be large enough to insert $1/(k+1)^2$.

- Let's see a few values of the sum:
 - ▶ 1/1 = 1.
 - ▶ 1/1 + 1/4 = 1.25.
 - $1/1 + 1/4 + 1/9 \approx 1.361.$
 - $1/1 + 1/4 + 1/9 + 1/16 \approx 1.4236.$
 - ► $1/1 + 1/4 + 1/9 + 1/16 + 1/25 \approx 1.4636$.

Yes, there is a gap. But how large?

- ▶ We need the gap to be large enough to insert $1/(k+1)^2$.
- After a "mysterious" moment, we observe that

$$\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \dots + \frac{1}{n^2} \le 2 - \frac{1}{n}.$$

Theorem 2 For any integer $n \geq 1$, $\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \dots + \frac{1}{n^2} \leq 2 - \frac{1}{n}$.

Theorem 2

For any integer $n \ge 1$, $\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \dots + \frac{1}{n^2} \le 2 - \frac{1}{n}$.

Proof.

(... the beginning is left out ...)

Inductive step: For $k \geq 1$, assume that $\frac{1}{1^2} + \frac{1}{2^2} + \cdots + \frac{1}{k^2} \leq 2 - \frac{1}{k}$. Adding $1/(k+1)^2$ on both sides, we get

$$\frac{1}{1^2} + \frac{1}{2^2} + \dots + \frac{1}{k^2} + \frac{1}{(k+1)^2} \le 2 - \frac{1}{k} + \frac{1}{(k+1)^2} = 2 - \left(\frac{1}{k} - \frac{1}{(k+1)^2}\right).$$

Since 1/k - 1/(k+1) = 1/(k(k+1)), we have that

$$1/(k+1) = 1/k - 1/(k(k+1)) < 1/k - 1/(k+1)^{2}.$$

Therefore, we conclude that

$$\frac{1}{1^2} + \frac{1}{2^2} + \dots + \frac{1}{k^2} + \frac{1}{(k+1)^2} \le 2 - \left(\frac{1}{k} - \frac{1}{(k+1)^2}\right) \le 2 - \frac{1}{k+1},$$

as required.

A Lesson learned

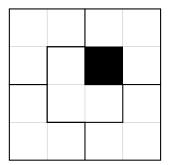

▶ Is a stronger statement easier to prove?

A Lesson learned

- Is a stronger statement easier to prove?
- In this case, the statement is indeed stronger, but the induction hypothesis gets stronger as well. Sometimes, this works out nicely.

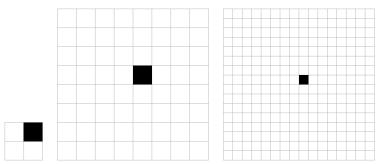

L-shaped tiles (1)

A 4x4 area with a hole in the middle can be tiled with L-shaped tiles.

L-shaped tiles (2)

This is true for 2×2 area, 8×8 area, even 16×16 area.

This motivates us to try to prove that it is possible to use L-shaped tiles to tile a $2^n \times 2^n$ area.

Theorem 3

For integer $n \ge 1$, an area of size $2^n \times 2^n$ with one hole in the middle can be tiled with L-shaped tiles.

Proof: We prove by induction on n.

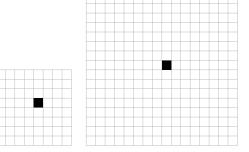

Base case: For $n=1,\,2^1\times 2^1$ area with a hole in the middle can be tiled.

Inductive step: Assume that for $k \ge 1$, an $2^k \times 2^k$ area with a hole in the middle can be tiled. We shall prove the statement for n=k+1, i.e., that an $2^{k+1} \times 2^{k+1}$ area with one hole in the middle can be tiled.

(cont. on the next page)

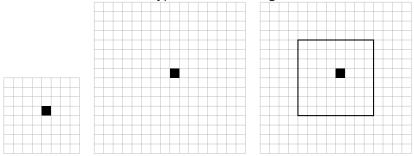

Proof: (cont.)

Let's see the Induction Hypothesis and the goal:

Proof: (cont.)

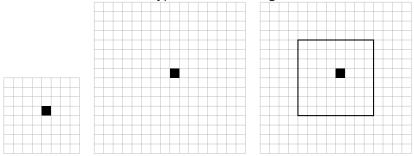

Let's see the Induction Hypothesis and the goal:

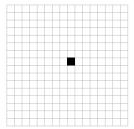

With the current form of the Induction Hypothesis, this is probably the way to use it.

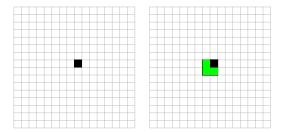

Proof: (cont.)

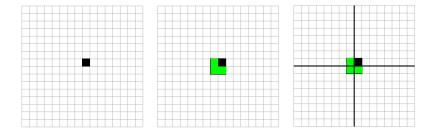

Let's see the Induction Hypothesis and the goal:

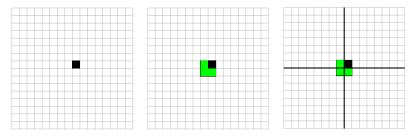

With the current form of the Induction Hypothesis, this is probably the way to use it. But it seems hard to go further with this approach....

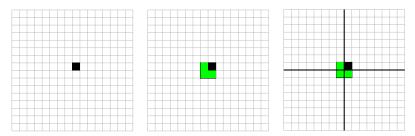

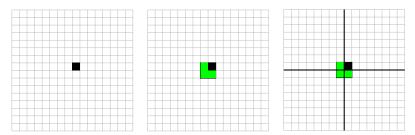

The last step seems nice, because it shows how we can solve the problem in the $2^{k+1}\times 2^{k+1}$ area with 4 problems in the $2^k\times 2^k$ areas.

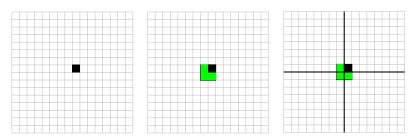

The last step seems nice, because it shows how we can solve the problem in the $2^{k+1} \times 2^{k+1}$ area with 4 problems in the $2^k \times 2^k$ areas. But do you see an issue with this approach regarding the Induction Hypothesis?

The last step seems nice, because it shows how we can solve the problem in the $2^{k+1} \times 2^{k+1}$ area with 4 problems in the $2^k \times 2^k$ areas. But do you see an issue with this approach regarding the Induction Hypothesis?

Current Inductive Hypothesis: Assume that for $k \ge 1$, an $2^k \times 2^k$ area with "a hole in the middle" can be tiled.

Current Inductive Hypothesis: Assume that for $k \geq 1$, an $2^k \times 2^k$ area with "a hole in the middle" can be tiled.

A Stronger Inductive Hypothesis: Assume that for $k \geq 1$, an $2^k \times 2^k$ area with one hole can be tiled.

A stronger statement

Theorem: For integer $n \ge 1$, an area of size $2^n \times 2^n$ with one hole can be tiled with L-shaped tiles.

Proof: We prove by induction on n.

Base case: For n=1, $2^1\times 2^1$ area with one hole can be tiled;

A stronger statement

Theorem: For integer $n \ge 1$, an area of size $2^n \times 2^n$ with one hole can be tiled with L-shaped tiles.

Proof: We prove by induction on n.

Base case: For $n=1,\ 2^1\times 2^1$ area with one hole can be tiled; there are 4 cases shown below.

A stronger statement

Theorem: For integer $n \ge 1$, an area of size $2^n \times 2^n$ with one hole can be tiled with L-shaped tiles.

Proof: We prove by induction on n.

Base case: For n=1, $2^1\times 2^1$ area with one hole can be tiled; there are 4 cases shown below.

Inductive step: Assume that for $k \geq 1$, an $2^k \times 2^k$ area with one hole can be tiled. We shall prove the statement for n=k+1, i.e., that an $2^{k+1} \times 2^{k+1}$ area with one hole can be tiled.

Inductive step: Assume that for $k \ge 1$, an $2^k \times 2^k$ area with one hole can be tiled. We shall prove the statement for n=k+1, i.e., that an $2^{k+1} \times 2^{k+1}$ area with one hole can be tiled. (Try to finish it in homework.)

Theorem 4

If P(1) and for any integer $k \ge 1$, $P(k) \Rightarrow P(k+1)$, then P(n) for all natural number n.

Proof.

Theorem 4

If P(1) and for any integer $k \ge 1$, $P(k) \Rightarrow P(k+1)$, then P(n) for all natural number n.

Proof.

We prove by contradiction.

Theorem 4

If P(1) and for any integer $k \ge 1$, $P(k) \Rightarrow P(k+1)$, then P(n) for all natural number n.

Proof.

We prove by contradiction. Assume that P(n) is not true for some natural number n.

Theorem 4

If P(1) and for any integer $k \ge 1$, $P(k) \Rightarrow P(k+1)$, then P(n) for all natural number n.

Proof.

We prove by contradiction. Assume that P(n) is not true for some natural number n. Let m be the smallest positive integer such that P(m) is false.

Theorem 4

If P(1) and for any integer $k \ge 1$, $P(k) \Rightarrow P(k+1)$, then P(n) for all natural number n.

Proof.

We prove by contradiction. Assume that P(n) is not true for some natural number n. Let m be the smallest positive integer such that P(m) is false. If m=1, we get a contradiction because we know that P(1) is true; therefore, we know that m>1.

Theorem 4

If P(1) and for any integer $k \ge 1$, $P(k) \Rightarrow P(k+1)$, then P(n) for all natural number n.

Proof.

We prove by contradiction. Assume that P(n) is not true for some natural number n. Let m be the smallest positive integer such that P(m) is false. If m=1, we get a contradiction because we know that P(1) is true; therefore, we know that m>1. Since m is smallest and m>1, then P(m-1) must be true.

Theorem 4

If P(1) and for any integer $k \ge 1$, $P(k) \Rightarrow P(k+1)$, then P(n) for all natural number n.

Proof.

We prove by contradiction. Assume that P(n) is not true for some natural number n. Let m be the smallest positive integer such that P(m) is false. If m=1, we get a contradiction because we know that P(1) is true; therefore, we know that m>1. Since m is smallest and m>1, then P(m-1) must be true. However, because for any integer $k\geq 1$, $P(k)\Rightarrow P(k+1)$, we can conclude that P(m) must be true. Again, we reach a contradiction.

Theorem 4

If P(1) and for any integer $k \ge 1$, $P(k) \Rightarrow P(k+1)$, then P(n) for all natural number n.

Proof.

We prove by contradiction. Assume that P(n) is not true for some natural number n. Let m be the smallest positive integer such that P(m) is false. If m=1, we get a contradiction because we know that P(1) is true; therefore, we know that m>1.

Since m is smallest and m>1, then P(m-1) must be true. However, because for any integer $k\geq 1$, $P(k)\Rightarrow P(k+1)$, we can conclude that P(m) must be true. Again, we reach a contradiction.

Therefore, P(n) is true for every positive integer n.

Theorem 4

If P(1) and for any integer $k \ge 1$, $P(k) \Rightarrow P(k+1)$, then P(n) for all natural number n.

Proof.

We prove by contradiction. Assume that P(n) is not true for some natural number n. Let m be the smallest positive integer such that P(m) is false. If m=1, we get a contradiction because we know that P(1) is true; therefore, we know that m>1.

Since m is smallest and m>1, then P(m-1) must be true. However, because for any integer $k\geq 1$, $P(k)\Rightarrow P(k+1)$, we can conclude that P(m) must be true. Again, we reach a contradiction.

Therefore, P(n) is true for every positive integer n.

Is this proof correct?

The Well-Ordering Property

▶ The proof of the Principle of Mathematical Induction depends on the following axiom of natural numbers N:

The Well-Ordering Property: Any nonempty subset $S\subseteq \mathbb{N}$ contains the smallest element.

The Well-Ordering Property

▶ The proof of the Principle of Mathematical Induction depends on the following axiom of natural numbers N:

The Well-Ordering Property: Any nonempty subset $S \subseteq \mathbb{N}$ contains the smallest element.

Previously, we use the well-ordering property of natural numbers to prove the Principle of Mathematical Induction, but it turns out that we can use the induction to prove the well-ordering property as well.

The Well-Ordering Property

▶ The proof of the Principle of Mathematical Induction depends on the following axiom of natural numbers N:

The Well-Ordering Property: Any nonempty subset $S\subseteq\mathbb{N}$ contains the smallest element.

Previously, we use the well-ordering property of natural numbers to prove the Principle of Mathematical Induction, but it turns out that we can use the induction to prove the well-ordering property as well. Therefore, we can take one as an axiom, and use it to prove the other.
